**THE CAMBRIDGE HANDBOOK OF ENVIRONMENTAL JUSTICE
AND SUSTAINABLE DEVELOPMENT**

Despite the global endorsement of the Sustainable Development Goals, environmental justice struggles are growing all over the world. These struggles are not isolated injustices, but symptoms of interlocking forms of oppression that privilege a few while inflicting misery on the many and threatening ecological collapse. This handbook offers critical perspectives on the multidimensional, intersectional nature of environmental injustice and the cross-cutting forms of oppression that unite and divide these struggles, including gender, race, poverty, and indigeneity. The work sheds new light on the often-neglected social dimension of sustainability and its relationship to human rights and environmental justice. Using a variety of legal frameworks and case studies from around the world, this volume illustrates the importance of overcoming the fragmentation of these legal frameworks and social movements in order to develop holistic solutions that promote justice and protect the planet's ecosystems at a time of intensifying economic and ecological crisis.

SUMUDU A. ATAPATTU is Director of Research Centers and International Programs at University of Wisconsin Law School, and Executive Director of the Human Rights Program. She is affiliated faculty with Raoul Wallenberg Institute for Human Rights, Sweden, and lead counsel for human rights at Centre for International Sustainable Development Law, Canada.

CARMEN G. GONZALEZ is the Morris I. Leibman Professor of Law at Loyola University Chicago School of Law, and Professor Emerita at Seattle University School of Law. She has published widely on international environmental law, human rights and the environment, and environmental justice. Professor Gonzalez has chaired the Environmental Law Section of the Association of American Law Schools, and served as member and deputy chair of the Governing Board of the IUCN Academy of Environmental Law. She is currently a member of the Board of Trustees of Earthjustice, the largest public interest environmental law firm in the United States.

SARA L. SECK is an associate professor with the Schulich School of Law and Marine & Environmental Law Institute, Dalhousie University. In 2015, she received the IUCN Academy of Environmental Law's Emerging Scholarship Award. She is a regional director with the Global Network for the study of Human Rights and the Environment.

Contributors

Sumudu A. Atapattu is the Director of Research Centers and International Programs at University of Wisconsin Law School, and Executive Director of the Human Rights Program. She is lead counsel for Human Rights at the Centre for International Sustainable Development Law, Canada, affiliated faculty at the Raoul Wallenberg Institute for Human Rights, Sweden and formerly, Senior Lecturer, Faculty of Law, University of Colombo, Sri Lanka.

Rebecca M. Bratspies teaches at the CUNY School of Law and directs the CUNY Center for Urban Environmental Reform. Her research explores the role of individuals and communities in the regulatory state, human rights, environmental democracy, and food justice. Her environmental justice comic books (*Mayah's Lot*, *Bina's Plant*) have been used widely in classrooms and by state environmental agencies. She serves on the US Environmental Protection Agency's Children's Environmental Health Protection Advisory Committee, is a member-scholar with the Center for Progressive Reform and the Environmental Law Collective. She blogs with the Nature of Cities. She is past chair of the AALS Section on Environmental Law.

Robert W. Collin is an author, environmental justice activist, and retired professor, with master's degrees in law, social work, and urban planning. He is a former member of the National Environmental Justice Advisory Committee at the US Environmental Protection Agency. Robert was appointed to the Oregon Environmental Justice Task Force, serving continuously since its formation in 2009, and is currently vice chair.

Barbara Cosens is a University Distinguished Professor Emerita with the University of Idaho College of Law, where she has taught for the sixteen years. Her LLM is from Lewis and Clark Law School, JD from the University of California, Hastings, MS in geology from the University of Washington, and BS in geology from the University of California, Davis. Her teaching and research expertise is in water law, the law–science interface and water dispute resolution. She is co-PI on the UI Water Resources IGERT focused on adaptation to climate change. She cochaired the Adaptive Water Governance project made possible through support from the NSF funded National Socio-Environmental Synthesis Center, SESYNC, and spent spring 2015 at the Goyder Institute in Australia comparing water law reform in western USA and Australia during drought. In her outreach and engagement, she provides education and expertise on the Columbia River Treaty as part of the Universities Consortium on Columbia River Governance.

Erin Daly is Professor of Law at Delaware Law School and Executive Director of Dignity Rights International; she also serves as the Director of the Global Network for Human Rights and the Environment. With James May, she has written extensively on human rights and the environment and on environmental constitutionalism. She is the author of *Dignity Rights: Courts, Constitutions, and the Worth of the Human Person* (2012) and numerous other publications on the emerging law of dignity rights. She and Professor May are working on the first global casebook on dignity rights.

Jackie Dugard is an associate professor at the School of Law, University of the Witwatersrand (Wits), where she focuses on power and exclusion. Jackie was a cofounder and the first Executive Director (2010–2012) of the Socio-Economic Rights Institute of South Africa, where she is a board member. Jackie was the founder and first Director of the Gender Equity Office at Wits (2014–2016). She is on the Advisory Board of the Southern Centre for Inequality Studies at Wits, and she is a global fellow at the Centre on Law and Social Transformation (Bergen University), and an associated senior researcher at the Chr. Michelsen Institute in Norway. In May 2019, Jackie became a member of the South African Ministerial Task Team to advise on matters related to sexual harassment and gender-based violence at South African universities.

Patrícia Galvão Ferreira is an assistant professor in transnational law at the University of Windsor Faculty of Law, in Canada. She teaches environmental law and international environmental law, and is the Director of the Transnational Environmental and Policy Clinic. Dr. Galvão Ferreira holds an LLB from the Federal University of Bahia in Brazil and an LLM from the University of Notre Dame in the USA. She holds an SJD from the Faculty of Law, University of Toronto, which she earned concurrently with an interdisciplinary PhD in dynamics of global change from the Munk School of Global Affairs, University of Toronto. Dr. Galvão Ferreira's research interests include transnational environmental law, transnational climate change law, environmental justice, human rights law, and law and development.

Joshua C. Gellers is an associate professor in the Department of Political Science and Public Administration at the University of North Florida, research fellow of the Earth System Governance Project, and Fulbright Scholar to Sri Lanka. He is the author of *The Global Emergence of Constitutional Environmental Rights* (2017).

Carmen G. Gonzalez is the Morris I. Leibman Professor of Law at Loyola University Chicago School of Law. She is Professor Emerita at Seattle University School of Law. She has published widely in the areas of international environmental law, human rights and the environment, environmental justice, and food security. Professor Gonzalez holds a BA from Yale University and a JD from Harvard Law School.

Lakshman Guruswamy is the Nicholas Doman Professor of International Law at the University of Colorado at Boulder. His work explores how and why energy justice calls for the fashioning of practical solutions for the energy poor inhabiting the least developed parts of the developing world.

Angela P. Harris is Professor Emerita at the University of California, Davis School of Law. Her work is centered on critical legal theory, including critical race theory, feminist legal theory, and law and political economy. Her current work considers the impact of climate catastrophe on theories of social justice.

Stellina Jolly is a senior assistant professor at the Faculty of Legal Studies South Asian University, a Fulbright Scholar at the University of San Francisco, and a recipient of the

International Visitors Leadership Program. Dr. Jolly's research focuses on international environmental law and conflict of laws.

Alice Kaswan is Professor and Associate Dean for Faculty Scholarship at the University of San Francisco School of Law. An expert on climate justice, federalism, and US climate policy, she received her BS in Conservation and Resource Studies from UC Berkeley and her JD from Harvard Law School.

Sabaa A. Khan is an attorney member of the Barreau du Québec (Canada) and senior researcher at the Center for Climate Change, Energy and Environmental Law (University of Eastern Finland). She specializes in public international law as it relates to trade, environment, and labor.

Louis J. Kotzé is Research Professor of Environmental Law at North-West University, South Africa, and Senior Visiting Professorial Fellow in Earth System Law at the University of Lincoln, United Kingdom. His research focuses on law and the Anthropocene, environmental constitutionalism, and earth system law.

Konstantia Koutouki is a full professor at the Université de Montréal, Senior Fellow at the McGill University Centre for International Sustainable Development Law, and Executive Director of Nomomente Institute. She has extensive expertise in international law as it relates to the social, economic, and cultural development of local and Indigenous communities, as well as the preservation of natural spaces and ancient knowledge. In particular she is interested in traditional medicine, living soils, cultural expressions, and human/ecosystems well-being.

Elizabeth Ann Kronk Warner is the Dean of the S.J. Quinney College of Law at the University of Utah, where she is also a professor of law. She is an enrolled citizen of the Sault Ste. Marie Tribe of Chippewa Indians.

Katherine Loftis is a Research Associate with McGill University's Disability-Inclusive Climate Action Research Program and with the Canada Research Chair in Human Rights, Health, and the Environment. She holds master's degrees in both law and English literature, and has worked at the intersections of environmental governance, human rights, and climate change for more than a decade.

Deborah McGregor joined York University's Osgoode Hall law faculty in 2015 as a cross-appointee with the Faculty of Environmental Studies. Professor McGregor's research has focused on Indigenous knowledge systems and their various applications in diverse contexts including water and environmental governance, environmental justice, health, and climate justice.

Mario Mancilla is a law professor at the Universidad de San Carlos, at the Universidad Mariano Gálvez, and at the Escuela de Estudios Judiciales de Guatemala. He teaches environmental law, international environmental law, constitutional law, sociology of law, and philosophy of law. He has been a visiting professor in several universities in Central America and the Dominican Republic. Professor Mancilla holds an M.Sc. in constitutional law from the Universidad de San Carlos de Guatemala, a PhD in law from the Universidad Mariano Gálvez de Guatemala, and is doctoral candidate in political science and sociology at the Universidad Pontificia de Salamanca in Spain. He is also an attorney and public notary for the Universidad de San Carlos de Guatemala.

James R. May is Distinguished Professor of Law and Co-founder and Codirector of the Dignity Rights Project and the Environmental Rights Institute at Widener University Delaware Law

School, the Cofounder and Codirector of Dignity Rights International, and past inaugural chief sustainability officer at Widener University, where he founded the Widener Sustainability Initiative. He is an inductee of Phi Kappa Phi National Honor Society, and the American College of Environmental Lawyers, and has served as consultant to the United Nations Environment Programme and the International Senior Lawyers Project, among others.

Tamar Meshel is an assistant professor at the University of Alberta Faculty of Law. Dr. Meshel's research focuses on international water law, international arbitration, and various areas of public international law. She also teaches and researches in tort law, corporate law, and securities law.

Robin Morris Collin is the Norma J. Paulus Professor of law at Willamette University College of Law. She is the first US law professor to teach sustainability courses in a US law school. Her publications include "Restoration and Redemption," in *Moral Ground: Ethical Action for a Planet in Peril* (2011).

Usha Natarajan is Edward W Said Fellow at Columbia University, Global South Visiting Scholar at the University of British Columbia, and Senior Fellow at Melbourne Law School. Natarajan was tenured at the American University in Cairo as Associate Professor of International Law and Associate Director of the Center for Migration and Refugee Studies. Previously, she worked with UNDP, UNESCO and the World Bank.

Quoc Nguyen is an attorney-adviser at the US Environmental Protection Agency Office of General Counsel. She provides legal counsel and litigates on environmental information law issues.

Damilola S. Olawuyi, SAN, is an associate professor of petroleum, energy and environmental law at Hamad Bin Khalifa University (HBKU) College of Law, Doha, Qatar. He is also Chancellor's Fellow and Director of the Institute for Oil, Gas, Energy, Environment and Sustainable Development (OGEES Institute), Afe Babalola University, Ado Ekiti, Nigeria. He is an Independent Expert of the Working Group on Extractive Industries, Environment, and Human Rights Violations in Africa formed by the African Commission on Human and Peoples' Rights.

Mona Paré is Associate Professor at University of Ottawa's Faculty of Law, Civil Law Section. She holds a PhD in law from Queen Mary College, University of London. She is cofounder of the Interdisciplinary Research Laboratory on the Rights of the Child at uOttawa.

Antoni Pigrau is Professor of Public International Law, Universitat Rovira i Virgili (Tarragona, Spain), Director of the Tarragona Centre for Environmental Law Studies, and Director of the *Catalan Journal of Environmental Law*. Antoni is a member of the European Environmental Law Forum Advisory Board, and member of the Advisory Board of the Network on Business, Conflict and Human Rights.

Shyami Puvimanasinghe is Human Rights Officer, Right to Development Section, Office of the United Nations High Commissioner for Human Rights, Geneva, Switzerland, and a senior research fellow, Centre for International Sustainable Development Law. Formerly senior lecturer, Faculty of Law, University of Colombo, Sri Lanka.

Jacinta Ruru (Raukawa, Ngāti Ranginui) is Professor of Law at the University of Otago, Codirector of Ngā Pae o te Māramatanga New Zealand's Centre of Māori Research Excellence, fellow of the Royal Society Te Apārangi, and recipient of New Zealand Prime Minister's Supreme Award for Excellence in Tertiary Teaching.

Boaventura de Sousa Santos is a full professor at the University of Coimbra, School of Economics, Department of Sociology, in Portugal, and a Distinguished Scholar of the Institute for Legal Studies at the University of Wisconsin Law School. He has published prolifically on issues related to law and globalization, legal pluralism, multiculturalism, and human rights, and has taught at law schools and graduate programs in Brazil, England, Mexico, Argentina, Colombia, Angola, Mozambique, and Spain, in addition to his current Coimbra, Portugal and Madison posts.

Dayna Nadine Scott is an associate professor at Osgoode Hall Law School and the Faculty of Environmental and Urban Change at York University. She is also the York Research Chair in Environmental Law & Justice in the Green Economy. Professor Scott's research focuses on contestation over extraction, the distribution of pollution burdens, and climate justice.

Sara L. Seck is an associate professor with the Schulich School of Law and Marine & Environmental Law Institute, Dalhousie University, Canada. Her research considers environmental and climate justice with attention to gender, Indigenous law, and insights from relational theorists; business, human rights, and transnational law; and critical approaches to public and private international law and sustainable development.

Andrea C. Simonelli is an assistant professor of human security at Virginia Commonwealth University and Founder of Adaptation Strategies International. Her research investigates climate-induced migration as well as the relationship between island resilience, adaptation, and governance in the Maldives and greater Pacific, which includes extensive fieldwork.

Penelope Simons is an associate professor at the Faculty of Law (Common Law Section) at the University of Ottawa. Her research focuses on business and human rights and in particular on: the human rights implications of domestic and transnational extractive sector activity; state responsibility for corporate complicity in human rights violations; the regulation of transnational corporations; gender and resource extraction; as well as the intersections between transnational corporate activity, human rights, and international economic law.

Adrian A. Smith is an associate professor at Osgoode Hall Law School in Toronto, Canada. He is currently serving as Academic Director of the Intensive Program in Poverty Law. His research addresses labor, law, and political economy in colonial and settler colonial contexts.

Linda Tsang is a legislative attorney at the Congressional Research Service of the Library of Congress. She works on legal issues related to environmental, energy, climate change, administrative, and constitutional law.

Tseming Yang is Professor of Law and Director of the Center for Global Law and Policy at the Santa Clara University School of Law. In 2010–2012, he served as deputy general counsel of the US Environmental Protection Agency. His research focuses on environmental justice as well as comparative and international environmental law.

Acknowledgments

This project would not have been possible without the collaboration and support of many people and institutions. We would like to thank all our contributors, who produced their chapters amidst many demands on their time. They were very gracious about the editorial comments and suggestions and worked with us to ensure that the central themes of the book – environmental justice and sustainable development – were highlighted in their chapters. We would like to thank them for their contribution to our volume as well as their continued dedication to scholarship and advocacy.

We owe a particular debt of gratitude to Sarah MacLeod, a recent JD graduate from the Schulich School of Law, Dalhousie University, who worked tirelessly to ensure that all the chapters were formatted properly and were ready for submission. Without her, we would have been lost and this book would not have seen the light of day. Her dedication and meticulous attention to detail as well as her editorial skills, were invaluable. Sara Seck is very grateful to the Schulich School of Law, Dalhousie University for research funding in support of Sarah MacLeod's contributions.

We are most grateful to Professor Boaventura de Sousa Santos for writing the Foreword. We would also like to acknowledge the support of Cambridge University Press, especially Matt Gallaway, who very graciously accommodated our many requests for extensions.

Sumudu Atapattu would like to thank University of Wisconsin Law School for research support and the students of the *Wisconsin International Law Journal* who hosted a symposium in 2018 based on the book project in which many of the contributors participated. She gratefully acknowledges the support of the Laurie Carlson Progressive Ideas Forum for supporting a workshop following the symposium to discuss the edited volume.

Carmen G. Gonzalez would like to thank Seattle University School of Law and Loyola University Chicago School of Law for the research support that made it possible to present the ideas in this volume at several scholarly conferences and workshops.

Finally, we would like to thank our families for their continued love, patience, and ongoing support and encouragement.

Foreword (on Living in an Interregnum)

This book deals with two main topics, one with an already long and controversial history (sustainable development) and another with a shorter but equally controversial history (environmental justice). It could therefore be one more book about conceptual history (the narratives, discourses, and practices unfolding from such mainstream concepts) and a rereading of the controversies that make up such history. The importance of this book lies in the fact that it is not such a book. It is rather a book which, however fully accounting for the contemporary histories of these topics and the controversies surrounding them, is dialectically (and tragically) aware that it is coming at the end of an epoch dominated by these topics, an epoch consisting of both the issues these topics credibly highlighted and the issues they cunningly obscured or made invisible. In this way, the discussion on sustainable development slides into the discussion on the highly problematic development of sustainability, as much as the discussion on environmental justice slides into the discussion on the highly dubious justice in/of conceiving of the environment as a separate entity, added to many other conditions that make life on earth possible in a dignifying way for both humans and nonhumans.

The deep flaws of the mainstream renditions of the controversial trajectory of these topics come out very clearly in this book. I identify three of them. First, as long as infinite economic growth remains as a dogma we will be cruising the *Titanic* and be part of its fateful destiny. If escaping is still possible, an intellectual and political move imposes itself: from alternative development to alternatives to development. Second, this move is extremely difficult because it demands confronting the three main modes of modern domination: capitalism (exploitation of labor power), colonialism (racism, slave labor, accumulation by dispossession), and patriarchy (sexism and all forms of gender discrimination). Third, global social justice is not possible without global cognitive justice. If I am allowed to quote myself, “the quest for the recognition and celebration of the epistemological diversity of the world underlying the epistemologies of the south requires that these new (actually, often ancestral and newly reinvented) repertoires of human dignity and social liberation be conceived of as being relevant far beyond the social groups that caused them to emerge from their struggles against oppression” (*The End of the Cognitive Empire* (Durham, NC: Duke University Press, 2018), p. 11).

This book sometimes suggests, sometimes cries loudly that we live in an interregnum, a period similar to the one analyzed by Antonio Gramsci in the early 1930s and characterized by the fact that the old is not yet completely dead while the new is not yet fully born. The antinomies of the old go on causing much damage and suffering in the world to both humans and nonhumans, while the new is forcing its entry into history more and more convincingly. The morbidity of our

time lies in this historical and existential ambiguity. This book is by far the best I have read in years about the antinomies of our historical and existential condition. It is therefore a must-read for those who want to understand why so much rhetorical investment in the topics of sustainable development and environmental justice have accomplished so little. And equally for those for whom a new beginning is necessary, a new gestalt, with new concerns, radically different objectives, discourses, practices, and, above all, different ways of knowing and living.

Boaventura de Sousa Santos

Intersections of Environmental Justice and Sustainable Development

Framing the Issues

Sumudu A. Atapattu, Carmen G. Gonzalez, and Sara L. Seck

1.1 INTRODUCTION

Humanity stands at a critical juncture. It has entered a new geologic era called the “Anthropocene,”¹ in which unbridled economic activity threatens irreversible ecological harm. In the name of “development,” human beings have caused massive ecosystem destruction and species extinction, disrupted the planet’s climate, and generated vast amounts of toxic waste – exceeding the assimilative and regenerative capacity of nature.

Global statistics are sobering. The world has entered a sixth wave of mass extinction where, according to some estimates, 27,000 species vanish every year² and about one million species currently face extinction.³ Climate change is accelerating more rapidly than scientists predicted, leading the World Meteorological Organization to warn that lack of aggressive mitigation measures will likely result in a catastrophic temperature increase of 3–5 degrees Celsius (5.4–9.0 degrees Fahrenheit) above preindustrial levels by 2100.⁴ In 2016, the world generated 242 million tons of plastic waste.⁵ If present trends continue, there will be more plastic in the oceans than fish by 2050.⁶ Between 1945 and the present, the worldwide generation of hazardous

⁶ R. Harrington, “By 2050, the Oceans Could Have More Plastic than Fish,” Jan. 26, 2017, www.businessinsider.com/plastic-in-ocean-outweighs-fish-evidence-report-2017-1.

waste increased from 5 million to 400 million tons *per year*.⁷ Much of this waste is generated in affluent countries (the Global North) and is exported to poor and middle-income countries (the Global South) for disposal⁸ – a practice that has been denounced as “toxic colonialism.” From heavy metals in soils to the chemical contamination of air and water, the extraction of wealth from nature and the disposal of wastes has rendered some places on earth so toxic that they are not suitable for human habitation.⁹ Every year, air pollution kills more than seven million people, while lack of access to fresh water and sanitation has been linked to the death of five million people per year.¹⁰

It is important to recognize that not every person or every state contributed equally to environmental destruction. Nor do all segments of society lead unsustainable lifestyles. Sadly, those who contributed the least to environmental degradation are disproportionately exposed to the resulting harm. In affluent and impoverished countries alike, it is the poor and vulnerable who pay the price for the consumption-driven lifestyles of national and global elites. This imbalance between those who benefit from economic activity and those who bear its adverse social and environmental impacts is one of the hallmarks of environmental injustice.

This volume seeks to examine the complex and multidimensional forms of oppression that produce environmental injustice at the national and international level and the legal frameworks and strategies that have been deployed to combat these injustices. The goal is to develop a more robust conception of environmental justice by engaging with the literature on sustainable development and human rights – particularly the often-neglected social pillar of sustainable development. As many of the case studies in this volume illustrate, environmental justice struggles overlap with struggles for other forms of justice. Despite these overlaps and intersections, the literature on environmental justice often treats them as single, isolated challenges without taking the larger context and underlying historical causes into consideration. As a result, the “solutions” that are adopted or proposed do not address the structural issues that give rise to intersecting forms of injustice, many of them dating back to the colonial era.¹¹ And the separation of environmental law from other bodies of law makes it impossible to address the root causes of many of these injustices in economic, trade, and investment law.¹²

This chapter proceeds as follows. Section 1.2 describes the evolution of the concept of sustainable development from the 1987 report of the World Commission on Environment and Development (WCED) to the Sustainable Development Goals (SDGs). It discusses contemporary degrowth and green growth movements, before introducing the relatively novel concept of just sustainabilities, a synthesis of environmental justice and sustainable development. Section 1.3 defines environmental justice and discusses its relationship to human rights and the social pillar of sustainable development, reflecting on which dimensions of environmental justice are well reflected in this book and which proved more difficult to address. Section 1.4 then provides an outline of the volume, and assesses limitations, challenges, and areas for further research.

⁷ The World Counts, “Hazardous Waste Statistics,” www.theworldcounts.com/counters/waste_pollution_facts/hazardous_waste_statistics.

⁸ The disposal of hazardous waste can cost as much as US\$2,000 per ton in developed country versus just US\$40 per ton in Africa (Hunter et al., note 2, p. 11).

⁹ For example, La Oroya in Peru, the site of a lead smelter, is regarded as one of the world’s most polluted places. B. Walsh, “The World’s Most Polluted Places: La Oroya, Peru,” http://content.time.com/time/specials/2007/article/0,28804,1661031_1661028_1661020,00.html.

¹² See *ibid.*, Chapters 5 and 29.

1.2 SUSTAINABLE DEVELOPMENT FROM BRUNDTLAND TO THE SDGS

Prior to the advent of sustainable development, the right to development was promoted by the Global South as a manifestation of their right to self-determination.¹³ The right to development and sustainable development operated in parallel until the adoption of the SDGs in 2015.¹⁴ Sustainable development has emerged as the overarching framework for environmental governance¹⁵ and a potential alternative to the dominant economic development paradigm.¹⁶ It has come a long way since it was first popularized by the 1987 report of the WCED, also known as the Brundtland Commission.¹⁷

Defined as “development that meets the needs of the present without compromising the ability of future generations to meet their needs,”¹⁸ sustainable development initially required the balancing of two pillars – economic development and environmental protection.¹⁹ The binary nature of sustainable development was modified at the 1995 World Summit for Social Development, which added a third pillar: social development.²⁰ As explained in the Summit’s Declaration:

[E]conomic development, social development and environmental protection are interdependent and mutually reinforcing components of sustainable development, which is the framework for our efforts to achieve a higher quality of life for all people. Equitable social development that recognizes empowering of the poor to utilize environmental resources sustainably is a necessary foundation for sustainable development. We also recognize that broad-based and sustained economic growth in the context of sustainable development is necessary to sustain social development and social justice.²¹

Influenced by the Copenhagen Declaration, the 2002 Johannesburg Declaration on Sustainable Development²² affirmed “collective responsibility to advance and strengthen the interdependent and mutually reinforcing pillars of sustainable development – economic development, social development and environmental protection – at the local, national, regional and global levels.”²³

¹³ See K. Mickelson, “The Stockholm Conference and the Creation of the South–North Divide in International Environmental Law,” in S. Alam, S. Atapattu, C. G. Gonzalez, and J. Razzaque (eds.), *International Environmental Law and the Global South* (Cambridge, UK: Cambridge University Press, 2015), p. 109.

²¹ *Ibid.*

²² UN World Summit on Sustainable Development, *Johannesburg Declaration on Sustainable Development*, Sept. 4, 2002, UN Doc. A/CONF.199/20.

²³ *Ibid.*, para. 5. While the Copenhagen Declaration added the social pillar to sustainable development, Agenda 21 adopted at the 1992 United Nations Conference on Environment and Development (UNCED) recognized the importance of social development. It recognized the need to combat poverty, address consumption patterns, and protect health, as well as promoting sustainable human settlements as coming within the social

Thus, sustainable development now comprises three pillars and requires the balancing of all three. But what does social development mean? This third pillar remains under-theorized,²⁴ but seems to encompass basic human needs such as access to food, water, healthcare, shelter, and education.²⁵ The social pillar intersects with human rights because many of these basic needs are expressed in rights language.²⁶

The commitments made by states in the Copenhagen Declaration elucidate the meaning of the social pillar. These commitments include: creating an economic, political, social, cultural, and legal environment that will enable people to achieve social development; eradicating poverty; promoting the goal of full employment to enable men and women to attain sustainable livelihoods; promoting social integration by fostering societies that are stable, safe, and just, based on the promotion and protection of all human rights and nondiscrimination; promoting full respect for human dignity to achieve equality and equity between men and women; and promoting and attaining the goals of universal and equitable access to quality education and the highest attainable standard of physical and mental health.

Sustainable development is said to embrace the “triple bottom line approach to human wellbeing.”²⁷ It aims for a combination of economic development, environmental sustainability, and social inclusion. Social inclusion includes principles such as nondiscrimination, gender equality, and participation. While states have the “sovereign right to exploit their own resources pursuant to their own environmental and developmental policies,”²⁸ this right is neither absolute nor limitless and “cannot lawfully be exercised without regard for the detrimental impact on human rights or the environment.”²⁹

If sustainable development resembles a three-legged stool, giving equal weight to each leg (environmental protection, economic development, and social development) is necessary to ensure that the stool (sustainable development) is stable. However, this depiction of sustainable development has been criticized for placing humanity *outside* the environment and failing to encourage us to recognize our place within the biosphere:³⁰

[I]t perpetuates an even older myth that the environment is something apart from humanity, humanity’s economy, and its social well-being. We do not discuss whether sustainable development itself is an oxymoronic concept. We do assume that sustainable development represents a real change in the way humans choose to live so that the viability and subsistence of all living species and their places are ensured.³¹

and economic dimensions of sustainable development. UN Sustainable Development, “United Nations Conference on Environment and Development: Agenda 21, June 3–14, 1992.

³⁰ See N. Dawe and K. Ryan, “The Faulty Three-Legged-Stool Model of Sustainable Development” (2003) 17 *Conservation Biology* 1458.

³¹ *Ibid.*

In other words, “the environment is not and cannot be a leg of the sustainable development stool. It is the *floor* upon which the stool, or any sustainable development model, must stand.”³² Because humanity and the economy cannot survive without the ecosystem services provided by nature,³³ environmental protection must be the foundation of all development activities. Critics question whether we will ever understand our place on the planet and choose to live within the limits set by the biosphere. Perhaps we can do it, but not by relying on the three-legged stool model “because it continues to place us outside those limits. And while we may be able to think outside the limits, we cannot live outside the limits.”³⁴

In short, one of the most significant critiques of sustainable development is that it fosters the illusion of unlimited economic growth on a finite planet.³⁵ Critics point out that the concept of sustainable development has been deployed by global elites to continue to subordinate nature to the imperatives of economic growth, while ignoring ecological limits and planetary boundaries.³⁶ An economic model based on perpetual economic growth and unbridled extraction of wealth from nature is ill-suited for the achievement of sustainable development. Relying on the same system that created the problem to fix the problem is shortsighted, to say the least. The case studies in this volume illustrate how states continue to give primacy to economic development over environmental protection and social development – to the detriment of species, ecosystems, and vulnerable human beings.

In many respects, sustainable development came of age with the adoption of the 2030 Agenda for Sustainable Development, with its seventeen SDGs and 169 targets.³⁷ The SDGs build on the Millennium Development Goals (MDGs) and seek to complete what the MDGs failed to achieve. However, the SDGs go much further. Never before have world leaders pledged common action across such a broad and universal policy agenda based on economic, social, and environmental targets within a human rights framework. The SDGs seek to realize human rights for all and to achieve gender equality and the empowerment of all women and girls. They are integrated and indivisible and balance the three dimensions of sustainable development: economic, social, and environmental. Agenda 2030 further recognized that each country faces specific challenges in its pursuit of sustainable development and that vulnerable people must be protected, including children, youth, persons with disabilities, people living with HIV/AIDS, older persons, Indigenous peoples, refugees, and internally displaced persons, and migrants.

Unlike the MDGs, the 2030 agenda and the SDGs are explicitly based on human rights:

We envisage a world of universal respect for human rights and human dignity, the rule of law, justice, equality and non-discrimination; of respect for race, ethnicity and cultural diversity; and of equal opportunity permitting the full realization of human potential and contributing to shared prosperity. A world which invests in its children and in which every child grows up free from violence and exploitation. A world in which every woman and girl enjoys full gender equality and all legal, social and economic barriers to their empowerment have been removed. A just, equitable, tolerant, open and socially inclusive world in which the needs of the most vulnerable are met.³⁸

³⁸ UN General Assembly, note 14.

It remains to be seen how much progress the international community will make toward achieving the SDGs by 2030. Although reducing poverty and improving the living standards of people has been on the global agenda since the creation of the UN, over one billion people continue to live in poverty.³⁹ The problem is not the failure to generate wealth, but the uneven distribution of this wealth, including its concentration in fewer and fewer hands.⁴⁰ In addition, the SDGs continue to envisage economic growth as the primary engine of poverty reduction. Goal 8, for example, seeks to increase gross domestic product (GDP) growth in the least developed countries along with higher levels of economic productivity in all countries.⁴¹ By failing to acknowledge the need to reduce economic growth in affluent countries in order to improve living standards in poor countries without exceeding ecological limits, the SDGs “fail to reconcile the contradiction between growth and sustainability at the core of sustainable development.”⁴²

Because the current capitalist economic model, with its emphasis on unlimited growth, is the main cause of the current environmental crisis, scholars, activists, and grassroots environmental justice movements have begun advocating for “degrowth.”⁴³ The idea of degrowth is emerging as a response to the triple crisis – environmental, social, and economic – we are facing. Degrowth is slowing down economic growth based on the narrow economic measure of GDP growth,⁴⁴ which, as the feminist movement pointed out, does not value what is not in the market, such as unpaid domestic work and voluntary work.⁴⁵ It questions the way of life linked to growth and asks what makes people really prosperous?⁴⁶ The production of goods and services and improving standards of living is the focus of the current economic model. However, “the ecological crisis tells us that this story of social progress through economic growth is highly questionable.”⁴⁷ Sustainable degrowth is defined as: “[a]n equitable down-scaling of production and consumption that increases human well-being and enhances ecological conditions at the local and global level.”⁴⁸ Proponents of sustainable degrowth do not propose degrowth across the board; they recognize that certain social and small-scale economic activities and impoverished

However, according to the World Bank, “in 2015, 10 percent of the world’s population lived on less than \$1.90 a day, down from nearly 36 percent in 1990. Progress has been uneven, and the number of people in extreme poverty remains unacceptably high. Given growth forecasts, the world is not on track to end extreme poverty by 2030” (“Poverty at a Glance,” www.worldbank.org/en/topic/poverty).

groups or regions may still need to grow. However, growth that externalizes its costs elsewhere is not sustainable.⁴⁹

While there is an urgent need to reduce the overall consumption of resources, it is no secret that most of this consumption takes place in the Global North, while much of the world's population remains mired in poverty. As the Degrowth Declaration of 2008 recognized: "By using more than their legitimate share of global environmental resources, the wealthiest nations are effectively reducing the environmental space available to poorer nations, and imposing adverse environmental impacts on them."⁵⁰ The Declaration also recognized that global economic growth has not succeeded in reducing poverty, that "unequal exchange in trade and financial markets" has increased inequality between countries,⁵¹ and that we need to bring economic activity in line with the capacity of our ecosystems and to redistribute wealth and income globally.⁵² The Declaration defines degrowth as "a voluntary transition towards a just, participatory and ecologically sustainable society."⁵³ Degrowth must occur in wealthy parts of the world through a transformation of the global economic system. The objectives of degrowth are "to meet basic human needs and ensure a high quality of life, while reducing the ecological impact of the global economy to a sustainable level, equitably distributed between nations."⁵⁴

Thus, the objectives of sustainable development and degrowth are similar. Degrowth, with its emphasis on reducing consumption in affluent countries, advocates for an alternative economic model that respects planetary boundaries.⁵⁵ Sustainable development has a similar objective at least in theory, even though it has failed to explicitly call for degrowth.

A second approach to the interlocking economic and ecological crises is the concept of the "green economy" or "green growth," often used interchangeably. This approach ranges from a narrow emphasis on eco-industry and environmentally friendly production to a redefinition of a country's entire economy.⁵⁶ Between these two extremes are policies that promote low-carbon economies with dematerialization, decoupling of resource use and environmental impacts from economic growth, valuing ecosystem services, or simply increasing energy efficiency.⁵⁷ United Nations Environment Programme (UNEP) has been a great proponent of the green economy as "an engine for growth," generating jobs and eradicating poverty. It defines green economy as "one that results in improved human well-being and social equity, while significantly reducing environmental risks and ecological scarcities."⁵⁸ According to UNEP:

In its simplest expression, a green economy can be thought of as one which is low carbon, resource efficient and socially inclusive. In a green economy, growth in income and employment should be driven by public and private investments that reduce carbon emissions and pollution, enhance

energy and resource efficiency, and prevent the loss of biodiversity and ecosystem services. These investments need to be catalysed and supported by targeted public expenditure, policy reforms and regulation changes. The development path should maintain, enhance and, where necessary, rebuild natural capital as a critical economic asset and as a source of public benefits, especially for poor people whose livelihoods and security depend on nature.⁵⁹

The UNEP report points out that the green economy does not replace sustainable development but creates an enabling framework for its realization. “Decades of creating new wealth through a ‘brown economy’ model have not substantially addressed social marginalization and resource depletion.”⁶⁰ In order to transition to a green economy, specific enabling conditions will be required but these conditions are currently heavily weighted toward the prevailing brown economy, which depends excessively on fossil fuel energy. The report seeks to debunk certain myths surrounding the green economy, the most widespread being that there is a trade-off between environmental sustainability and economic progress. UNEP insists that the “greening” of economies neither inhibits wealth creation nor employment opportunities.⁶¹

However, the notion of a green economy appears to pour old wine into new bottles, essentially preserving the status quo with a few minor tweaks. Indeed, since the green economy was floated as “an alternative” to the existing economic development model (brown economy as the UNEP report calls it) at Rio+20 conference in 2012, nothing much seems to have changed. In fact, as the UNEP’s own “Emissions Gap” report shows, greenhouse gas emissions have increased to a historic high level,⁶² and global dependence on fossil fuels has not declined.

The SDGs do not endorse the green economy or green growth. On the contrary, while SDG 12 refers to the need to ensure sustainable consumption and production patterns, SDG 8 continues to use GDP as a measure of economic success.⁶³ Rather than degrowth, SDG 8 promotes the need to *increase* the rate of economic growth:

Inclusive and sustainable economic growth can drive progress and generate the means to implement the Sustainable Development Goals. Globally, labour productivity has increased and unemployment is back to pre-financial crisis levels. However, the global economy is growing at a slower rate. More progress is needed to increase employment opportunities, particularly for young people, reduce informal employment and the gender pay gap and promote safe and secure working environments to create decent work for all.⁶⁴

In sum, while sustainable development might accommodate both degrowth and the green economy, degrowth is more likely to achieve sustainable development by slowing down the global economy and reducing consumption in affluent countries in order to give poor countries the ecological space to improve living standards. Regrettably, the SDGs preserve the status quo by calling for an increase in economic growth and merely labeling it “sustainable economic growth.” Unless we recognize that the current environmental crisis is due to an economic system premised on the unbridled extraction of wealth from nature and the exploitation and dispossession of human beings, we will only be tinkering at the margins without seeing any positive results. Real change requires recognizing that the environment is the floor on which both society and the economy rest.

⁶³ Target 8.1, note 41.

⁶⁴ “Progress of Goal 8 for 2019,” <https://sustainabledevelopment.un.org/sdg8>.

This volume seeks to fill a significant gap in the scholarly literature by examining the relationship between environmental justice and sustainable development, particularly its social pillar. One of the few frameworks that does attempt to address this relationship is the “just sustainabilities” framework proposed by Agyeman *et al.* The authors define “just sustainabilities” as “the need to ensure a better quality of life for all, now, and into the future, in a just and equitable manner, while living within the limits of supporting ecosystems.”⁶⁵ This framing encompasses fairness, equity including inter and intragenerational equity, precaution, environmental sustainability, and social justice. The authors acknowledge that:

In recent years it has become increasingly apparent that the issue of environmental quality is inextricably linked to that of human equality. Wherever in the world environmental despoliation and degradation is happening, it is almost always linked to questions of social justice, equity, rights and people’s quality of life in its widest sense.⁶⁶

The authors make three interrelated arguments in support of their framework. First, they point out that countries with more equal distributions of income, better rights, and higher literacy rates tend to have higher environmental quality than those who do not.⁶⁷ Second, they note that environmental problems tend to affect the poor disproportionately, even though the poor are not the major polluters. While the rich are better able to insulate themselves from the negative impacts of pollution and other environmental degradation, poor people lack the resources to do so.⁶⁸ Finally, they emphasize that sustainability “cannot be simply an ‘environmental’ concern, important though ‘environmental’ sustainability is. A truly sustainable society is one where wider questions of social needs and welfare, and economic opportunity, are integrally connected to environmental concerns.”⁶⁹

The “just sustainabilities” framework is a useful reminder that sustainability and environmental justice are inextricably intertwined. Sustainability cannot be achieved without considering social justice, economic opportunity, and environmental protection. But just what is environmental justice?

1.3 ENVIRONMENTAL JUSTICE

Environmental justice has become the rallying cry of subordinated communities throughout the world who are disproportionately burdened by environmental degradation. While social justice struggles with an environmental dimension can be found throughout history, the discourse of environmental justice emerged in the United States in the 1980s, as poor people and racial and ethnic minorities mobilized to combat the siting of polluting facilities and hazardous waste disposal sites in their communities.⁷⁰ In recent decades, vulnerable communities in both affluent and poor countries and even vulnerable states, such as the small island states, have embraced the discourse of environmental justice.⁷¹

⁶⁵ See J. Agyeman, R. D. Bullard, and B. Evans, (eds.), *Just Sustainabilities: Development in an Unequal World* (Boston, MA: MIT Press, 2003), p. 7 who believe that “one explanation for the success of the environmental justice movement can be seen in the mutual benefits of a coalition between environmental and social concerns.”

⁶⁶ *Ibid.*, p. 1.

⁶⁷ *Ibid.*

⁶⁸ *Ibid.*

⁶⁹ *Ibid.*, p. 2.

⁷¹ L. Temper, D. del Bene, and J. Martinez-Alier, “Mapping the Frontiers and Front Lines of Global Environmental Justice: The EJAtlas” (2015) 22 *Journal of Political Ecology* 255–278.

The language of environmental justice is morally compelling and has given a voice to marginalized communities. However, much of the literature on environmental justice has failed to develop a rigorous analysis of the complex ways that poverty, race, gender, indigeneity, age, and disability, among other identity characteristics, many of which are subject to protection under international human rights law, intersect to produce environmental injustice in specific contexts. In other words, the social pillar of sustainable development and its relationship to environmental justice is under-theorized.

Environmental justice scholars and activists have attempted to address this shortcoming by articulating a four-part definition of environmental justice consisting of distributive justice, procedural justice, corrective justice, and social justice.⁷² Distributive justice requires the fair allocation of the benefits and burdens of economic activity among and within nations.⁷³ Procedural justice calls for transparent, informed, and inclusive environmental decision-making processes.⁷⁴ Corrective justice requires governments to enforce environmental laws, compensate those whose rights are violated, and terminate the harm-producing conduct.⁷⁵ Social justice emphasizes that environmental struggles are inextricably intertwined with struggles for social and economic justice.⁷⁶ In other words, environmental injustice cannot be separated from economic exploitation, race and gender subordination, the marginalization of children, the elderly, immigrants, and persons with disabilities, the ongoing dispossession of Indigenous peoples, and the colonial and postcolonial domination of the Global South. As the case studies in this volume illustrate, environmental conflicts frequently involve multiple dimensions of environmental justice, and do not fit neatly into one of the four categories. Yet, it cannot be said that the case studies in this volume grapple with the full intersectional dimensions of environmental justice; rather, different dimensions are explored in different chapters, with some dimensions untouched, perhaps most notably disability.

The chapters in this volume expand upon the four-fold definition of environmental justice. For example, several of the chapters address the failure of Western law and policy to recognize and respect the lived experiences and world views of subaltern communities, particularly Indigenous peoples⁷⁷ – a phenomenon known as epistemic injustice. Coined by philosopher Miranda Fricker,⁷⁸ the concept of epistemic injustice has been used by prominent legal scholars, such as Rebecca Tsosie, to explain the harms caused by “the uncritical application of Western values, categories, and standards to the very different social experience” of Indigenous peoples.⁷⁹ The chapters in this volume shed light on the concept of epistemic

injustice by explaining the differences between Indigenous and Western knowledge, the ways in which Indigenous communities have been harmed by the subordination of their world views, and the importance of Indigenous epistemologies and cosmologies not only to Indigenous self-determination, but also to the achievement by all communities of environmental justice and sustainable development. In Latin America and Canada, for example, Indigenous cosmovisions have served as the foundation for alternatives to Eurocentric notions of development. Known as *buen vivir* or living well,⁸⁰ these alternative approaches deny the human–nature binary, reject the Western obsession with economic growth, and adopt a communitarian and participatory vision of environmental justice.⁸¹

The chapters in this volume also expand our understanding of environmental racism.⁸² Developed by the environmental justice movement in the United States, the term environmental racism refers to the disproportionate concentration of environmental hazards in racial and ethnic minority communities.⁸³ Who is racialized and how they are racialized is socially constructed, rather than phenotypically predetermined, and varies substantially from country to country and over time in relation to changing economic and political circumstances.⁸⁴ In the United States, for example, African Americans, Latinos, and Indigenous communities have long been racialized and subjected to inequitable environmental burdens.⁸⁵ Conversely, Jews and the Irish, who are currently usually classified as White, have a long history in Europe and the United States of being regarded as non-White.⁸⁶

Racialization is a global phenomenon embedded in the life cycle of fossil fuel–based capitalism. The extraction of wealth from nature was implemented through the dispossession and conquest of Indigenous peoples, through slavery, through the “slow violence” inflicted by the fossil fuel industry on marginalized communities, through the bloody resource wars instigated by the Global North in the Middle East, and through the colonial and postcolonial domination by White Euro-American elites of large segments of the world’s population.⁸⁷ These practices targeted populations constructed as non-White and were justified through a variety of legal doctrines, including *terra nullius*, the doctrine of discovery, the mandate system after World War I, and the trusteeship system after World War II. These doctrines depicted racialized peoples as so primitive and in need of “modernization and development” that their livelihoods and world views were not worthy of protection.⁸⁸ Ironically, those most susceptible to climate

change-related displacement (and to detention, criminalization, and deportation if they attempt to migrate to the Global North) are also overwhelmingly persons classified as non-White.⁸⁹ A race-conscious analysis of the capitalist world economy highlights the intersection of environmental justice struggles with other social movements, including movements for Indigenous rights, economic justice, immigrant rights, peace, reparations for slavery and colonialism, and for the restructuring of international economic laws and institutions that facilitate the plunder of nature and the impoverishment of the Global South.⁹⁰

Other intersecting forms of oppression are also crucial to consider,⁹¹ and yet are often not fully explored by environmental justice scholars. For example, several contributions to this volume consider the gender dimensions of environmental justice in detail,⁹² while others merely touch upon it in passing,⁹³ or not at all. Gender, like race, is socially constructed, and gender roles are therefore historically contingent. As noted in the Gender Guidance of the United Nations Working Group on Business and Human Rights:

The term “gender” refers to socially constructed roles of and power relations among men, women and gender non-binary persons, all of whom may be affected differently by business activities. However, considering that women have historically been discriminated against owing to patriarchal norms and power structures, the guidance in the report focuses only on women, although the gender framework proposed herein could be used in relation to any group of rights holders.⁹⁴

Similarly, yet more expansively, the understanding of gender embraced by Canada’s National Inquiry into Missing and Murdered Indigenous Women and Girls is an inclusive one that goes well beyond the biological binary of women and men, encompassing all identities and diverse sexualities, including, *inter alia*, gay, lesbian, bisexual, transgender, queer, and Two-Spirit, among other ways in which people self-identify.⁹⁵ While several chapters in the book address injustices involving violations of the human rights of women and girls, our contributors generally do not explicitly explore gender-based environmental injustices in this more fulsome manner.

Vulnerable communities do frequently frame their demands for environmental justice in the language of human rights, even though most human rights treaties do not contain explicit

⁹⁴ UN General Assembly, *Gender Dimensions of the Guiding Principles on Business and Human Rights*, May 23, 2019, UN Doc. A/HRC/41/43, para. 9 regarding scope and limitations. The report contains gender guidance for states and business enterprises in relation to all three pillars of the UN Guiding Principles on Business and Human Rights. The paragraph continues: “The guidance should be read together with other relevant standards, such as the standards of conduct for business, published by the Office of the United Nations High Commissioner for Human Rights, aimed at tackling discrimination against lesbian, gay, bisexual, transgender and intersex persons, and the Children’s Rights and Business Principles.”

⁹⁵ See National Inquiry into Missing and Murdered Indigenous Women and Girls, “Reclaiming Power and Place: The Final Report of the National Inquiry into Missing and Murdered Indigenous Women and Girls: Volume 1a,” 2019, p. 58 [MMIWG Final Report] where the National Inquiry interpreted its mandate widely “to include 2SLGBTQQIA people (people who are Two-Spirit, lesbian, gay, bisexual, transgender, queer, questioning, intersex, and asexual). This is particularly important for people who don’t fit the gender binary of ‘male’ or ‘female,’ since their gender isn’t reflected in a simple statement of ‘Indigenous women and girls’ . . . and as an explicit reminder that gender-diverse people’s needs must equally be taken into account.”

environmental provisions. National and international tribunals have concluded that environmental degradation violates existing human rights, including the rights to life, health, food, and water; the procedural rights to information, participation, and access to justice; the collective rights of Indigenous peoples to their ancestral lands and resources; and the right to a healthy environment, which is recognized in a large number of national constitutions as well as legislative provisions.⁹⁶

State obligations to protect, respect, and fulfil environmental human rights are often thought to be essential to achieving environmental and climate justice. For example, the 2018 Framework Principles on Human Rights and the Environment,⁹⁷ developed by the former Special Rapporteur on Human Rights and the Environment, note in Principles 1 and 2 that “States should ensure a safe, clean, healthy and sustainable environment in order to respect, protect, and fulfil human rights” while at the same time “States should respect, protect and fulfil human rights in order to ensure a safe, clean, healthy and sustainable environment.” The concept of a sustainable environment must also include a sustainable earth system, although it is rare for international legal instruments to state this with clarity.

Nondiscrimination is a cross-cutting theme in the 2018 Framework Principles, with Principle 3 calling upon states to “prohibit discrimination and ensure equal and effective protection against discrimination in relation to the enjoyment of a safe, clean, healthy, and sustainable environment.” Meanwhile, Principle 14 elaborates upon the need for states to take “additional measures to protect the rights of those who are most vulnerable to, or at particular risk from, environmental harm, taking into account their needs, risks, and capabilities.” The commentary points out that vulnerability may arise due to the unusual susceptibility of some to environmental harm, or due to a denial of human rights, or both.⁹⁸ Those who are at increased risk from environmental harm “often include women, children, persons living in poverty, members of indigenous peoples and traditional communities, older persons, persons with disabilities, ethnic, racial or other minorities and displaced persons.”⁹⁹

While women are among those identified as often vulnerable due to both susceptibility to environmental harm and denial of human rights, a full analysis of women’s rights violations will require attention to social and cultural dimensions. For example, not all women have the same relationship with land and water as the many Indigenous women who self-identify as water keepers or land protectors.¹⁰⁰ As a result, a women’s empowerment and equality response that

advocates increasing female representation in upper management of mining companies, for example, may not fully respond to the gender blindness of the mining industry if none of those women are Indigenous.¹⁰¹ Similarly, if the call for women's equality and empowerment, in keeping with SDG 5, is linked exclusively to ensuring access to education in science and technology disciplines, without embedding equal respect for local and Indigenous knowledge often held by Indigenous women, then the vital importance of two-eyed seeing for environmental and climate justice will be missed.¹⁰² The importance of education on environmental matters is noted in Framework Principle 6, as without the capacity to understand environmental risks, the public is not able to fully exercise their rights to express their views and participate effectively in environmental decision-making. Yet, whose knowledge is valued in decision-making matters as well.

The Framework Principles highlight other vulnerable groups who should be considered as part of an intersectional analysis, including children (the girl child), older people (grandmothers), those with disabilities, those living in poverty, and those who experience discrimination on the basis of race, ethnic, or other minority status, as well as those subject to environmental or climate-induced displacement. Principle 15 separately addresses the importance of compliance with obligations “to indigenous communities and members of traditional communities” in many ways, including through respect and protection of their rights to traditional lands, territories and resources, consulting them to obtain their free, prior, and informed consent, and respecting and protecting traditional knowledge and practices in conservation and sustainable use. This principle and commentary are silent on gender, although the United Nations Declaration on the Rights of Indigenous Peoples (UNDRIP) is not,¹⁰³ yet it is important to consider the gender dimensions of its implementation more deeply. Many Indigenous feminist scholars have noted the vital importance of not placing Indigenous women in the position of being seen to undermine their own community's self-determination and self-governance by seeking protection from the state (or a company) against their community.¹⁰⁴ A nuanced response is therefore required, and one that does not position the state (or company) as the savior of women against the uncivilized “other” that underlies international law's colonial history.¹⁰⁵ In some cases patriarchal norms have infiltrated local community governance as a result of colonial histories. Challenges to these social norms must come from within and are best supported – but not necessarily mandated – from outside. Similarly, women who take on the responsibility of serving as environmental human rights defenders may face challenges both from within and outside

¹⁰² On the importance of two-eyed seeing, see MMIWG Final Report, note 95, pp. 132–133. According to L'nu Mi'kmaq scholar Tuma Young, the concept of two-eyed seeing is very important: “An issue has to be looked at from two different perspectives: the Western perspective and the Indigenous perspective, so that this provides the whole picture for whoever is trying to understand the particular issue” (ibid., p. 132).

their communities, at times opposing development projects which are supported by others within their community, and subject to harassment if not violence for challenging gender norms.¹⁰⁶ These women must be supported, but this can only be achieved if intersectional dimensions are integrated into the response.

Beyond poverty, gender, and race, there are other environmental justice vulnerabilities to consider. A frequently missing one, including from this book, is disability. According to the World Health Organization (WHO), “vulnerability is the degree to which a population, individual or organization is unable to anticipate, cope with, resist and recover from the impacts of disasters.”¹⁰⁷ Disability should play a key role in the application of intersectionality, and an intersectional environmental justice framework should help us see disability justice and racial justice “as not separate but rather interconnected and at times the very same project.”¹⁰⁸ For example, in addition to poor people of color who were disproportionately affected by Hurricane Katrina, people with disabilities were also disproportionately affected, yet this did not receive much attention.¹⁰⁹

As the world experiences more and more adverse consequences of climate change, especially disasters and extreme weather events, we need to pay particular attention to those who will be trapped due to disability or age.¹¹⁰ The elderly are more prone to extreme weather events than younger age groups as they are less mobile and may not have support networks. For example, in the deadly heatwave in Europe in 2003, during which a record number of 30,000 people perished (15,000 in France alone), the elderly and chronically ill were the most susceptible to the heat.¹¹¹ Indeed, as the Deputy Director of Regional Programs of the Global Greengrants Fund has stated: “We are not truly an environmental justice organization unless we have the full understanding of fifteen percent of the world’s population. People with disabilities need to be a full part of finding solutions to unequal access to natural resources and right to a healthy environment.”¹¹²

As Kimberlé Crenshaw points out in her pioneering work on intersectionality:

If [we] began with addressing the needs and problems of those who are most disadvantaged and with restructuring and remaking the world where necessary, then others who are singularly disadvantaged would also benefit. In addition, it seems that placing those who are currently marginalized in the center is the most effective way to resist efforts to compartmentalize and undermine potential collective action.¹¹³

Closely aligned with the intersectionality theory is compound injustice. Proposed by Henry Shue, “compound injustice” occurs when an initial injustice paves the way for a second. An example is when colonial exploitation weakens the colonized nation to such an extent that the

colonizer can impose unequal treaties upon it even after it gains independence.¹¹⁴ The current economic subordination of the Global South¹¹⁵ is a good example of compound injustice.

Finally, environmental justice movements have recognized the limitations of human-centric conceptions of justice, and have embraced intergenerational justice (the rights of future generations)¹¹⁶ and the rights of nature to address some of these deficiencies.¹¹⁷ For example, the principles of environmental justice developed by the delegates to the 1991 First National People of Color Environmental Leadership Summit held in Washington, DC, recognized both intergenerational justice and the rights of nature.¹¹⁸ Principle 1 “affirms the sacredness of Mother Earth, ecological unity and the interdependence of all species, and the right to be free from ecological destruction.”¹¹⁹ Principle 3 “mandates the right to ethical, balanced and responsible uses of land and renewable resources in the interest of a sustainable planet for humans and other living things.”¹²⁰ Principle 17 “requires that we, as individuals, make personal and consumer choices to consume as little of Mother Earth’s resources and to produce as little waste as possible; and make the conscious decision to challenge and reprioritize our lifestyles to ensure the health of the natural world for present and future generations.”¹²¹ In order to operationalize these principles, some scholars have proposed specific criteria for equitably allocating the planet’s resources between humans and other living creatures.¹²²

In sum, while the environmental justice movement seeks to achieve justice for human beings, increasing attention is being paid to justice for other species.¹²³ Even the human rights framework, which until recently, was about protecting rights of *human beings*, is increasingly according rights to other species and to nature itself as seen in the 2017 Advisory Opinion of the Inter-American Court of Human Rights.¹²⁴

1.4 OUTLINE OF THE BOOK, CHALLENGES, OPTIONS, AND AREAS FOR FURTHER RESEARCH

This volume is divided into three parts. Part I examines the relationship among environmental justice, sustainable development, and human rights, through several theoretical frameworks. We begin with Erin Daly and James R. May’s exploration of human dignity and sustainability, in which they propose that the economic, social, and environmental pillars of sustainability are best

understood as indivisible aspects of a right to human dignity, rather than being seen as in competition. Usha Natarajan's chapter highlights the usefulness of an environmental justice framework for the Global South, as it facilitates resistance to the universalization that is dominant in international lawmaking, and calls attention to the experiences of subaltern communities so as to build solidarity and foster global change. Deborah McGregor then introduces an Indigenous environmental justice framework drawing upon Anishinabek knowledge systems that have existed for millennia, and questions whether sustainability could ever be achieved based only on human knowledge that ignores reciprocal relations with the natural world, ancestors, and future generations.

Next, Carmen G. Gonzalez introduces a racial capitalism framework for the Anthropocene, crafted to clarify how racial subordination, environmental degradation, and the capitalist world economy are interrelated, with the climate crisis serving to illuminate the links between forms of oppression that are otherwise seen as disconnected. The relationship between human rights and socioecological justice, informed by vulnerability theory, is explored in the chapter written by Louis J. Kotzé, who proposes that vulnerability's embodied yet post-identity approach could inform a move away from Western neoliberal human rights toward a more contingent understanding of the entire living order's vulnerability. Socioecological resilience and its relationship to the social pillar of sustainable development is the subject of Barbara Cosens's framework chapter, in which she clarifies that as a theory of system properties, resilience theory cannot be a substitute for normative goals evident in concepts such as sustainable development, yet resilience theory can confirm that just societies are better equipped to adapt to change. Finally, we conclude Part I with a coauthored contribution by Robin Morris Collin and Robert W. Collin, who provide a history of the US environmental justice movement and call for intergenerational and transformative development by linking place-based reparations with ecosystems and communities.

Part II, the heart of the book, consists of a series of case studies on selected environmental justice struggles in the Global North and the Global South. The case studies examine the intersecting forms of oppression that produce environmental injustice in specific contexts, and the legal strategies that can and have been developed to combat these inequities. Given the wide range of intersecting issues and the sheer number of environmental justice struggles around the world, this book can only scratch the surface of this topic. In order to provide some structure, the case studies are divided into five, at times, overlapping and interrelated sections: Strategies, Challenges, and Vulnerable Groups; Toxic Substances and Hazardous Wastes; Resource Extraction; Energy; and Climate Change.

Our first case study in the Strategies, Challenges, and Vulnerable Groups section is Shyami Puvimanasinghe's exploration of public interest litigation in South Asia and the role of selected environmental justice cases in realizing sustainable development, including through the adoption of the right to development. We then turn our attention to children's rights in a contribution by Mona Paré who considers the environmental justice implications of approaching the rights of children in sustainable development through an intergenerational equity lens as compared to a child rights lens. Moving to Latin America, Patrícia Galvão Ferreira and Mario Mancilla offer a case study of water as life from the perspective of the Indigenous communities in Totonicapán, Guatemala, and argue that the new Escazú Agreement on procedural environmental rights missed an opportunity to fully integrate the type of Indigenous cosmovision evident in Totonicapán's water governance system. Jacinta Ruru provides further insights into Indigenous environmental justice in her chapter on legislative changes in Aotearoa, New Zealand, that recognize the legal personality of land, a river, and a mountain, in keeping with

Māori Indigenous laws. Next, strategies to achieve water justice in Israel and the West Bank are explored by Tamar Meshel, who concludes that water justice for the Bedouin and Palestinians will not be forthcoming while the right to water is narrowly interpreted and divorced from historic contexts and socioeconomic conditions, as well as obligations of antidiscrimination. Damilola S. Olawuyi then considers how preexisting vulnerabilities of gender and indigeneity in postcolonial Africa combine to magnify risks in the context of climate change mitigation and adaptation in two Nigerian case studies. Finally, Lakshman Guruswamy, Joshua C. Gellers, and Sumudu Atapattu turn to the failure to date of varied environmental justice strategies in Sri Lanka to successfully challenge the construction of the Colombo International Financial City, part of China's Belt and Road Initiative.

Our second set of case studies turns to environmental injustice in relation to toxic substances and hazardous wastes. First, Sabaa Ahmad Khan explores international trade in hazardous chemicals and waste, concluding in part that a lack of transparency in global commodity chains inhibits our capacity to protect human and ecosystem health, but that embedding responsibility and accountability into a life cycle approach, including the business responsibility to respect human rights, could be transformative. Next, Quoc Nguyen, Linda Tsang, and Tseming Yang tell the story of the Wengyuan County Cancer Villages in China's Guangdong Province, revealing how the economic and social marginalization of some communities makes them less resilient to adverse environmental and health consequences, while also less able to seek legal recourse. Finally, Antoni Pigrau turns our attention to the Marshall Islands and its colonial history of nuclear testing as illustrative of how colonialism and a failure to remedy historic environmental injustice combine to prevent future realization of sustainable development.

The third set of case studies examines environmental justice challenges in the resource extraction context. Stellina Jolly first introduces the Vedanta case study in which the Indian Supreme Court embraced a new interpretation of tribal rights as an essential component of effective participation in sustainable development. Jackie Dugard examines the historic injustice of the Tudor Shaft case in South Africa and highlights the ineffectiveness of the South African government's single-axis approach to dealing with intersectional social and ecological disadvantage. Finally, Sara L. Seck and Penelope Simons examine Canada's role as both home and host state in the context of sustainable mining and environmental justice, drawing attention to the failure of Canada's domestic and transnational legal and policy responses to fully embrace respect for the human rights of women and girls.

Next, we consider four case studies involving energy. Rebecca M. Bratspies explores the environmental justice dimensions of the successful campaign to close the Poletti Power Plant in New York City, leading to improved environmental quality for an overburdened environmental justice community, yet failing to be truly transformative due to its failure to openly confront related legacies of racism. This is contrasted with Elizabeth Kronk Warner's recounting of the Dakota Access Pipeline story and the unsuccessful efforts of Tribes and water protectors to halt its construction, due to the failure of decision makers to take seriously the unique issues that Indigenous peoples face, including applicable domestic and international law, tribal sovereignty, and connection to land and waters. Next, Lakshman Guruswamy considers the challenges confronting the energy poor and the disproportionate impact of energy poverty on women, in violation of international justice and sustainable development. Finally, Adrian A. Smith and Dayna Nadine Scott examine the transformative potential of participation by Indigenous communities in large-scale renewable energy generation, when community led, drawing upon the experiences of the Batchewana First Nation in Ontario, Canada.

Our final set of three case studies explores the challenge of climate change. The first, by Alice Kaswan, considers climate justice implications in the Californian context of climate mitigation policies, with attention to participatory and distributive justice and the importance of climate transition initiatives recognizing underlying historic and socioeconomic contexts. The second case study, a chapter coauthored by Katherine Lofts and Konstantia Koutouki, turns to the Canadian Arctic and considers how integration of eco-health concerns in environmental impact assessment processes could help to better incorporate Inuit world views and knowledge, and so provide for greater adaptability to a rapidly changing environment. Finally, Sumudu Atapattu and Andrea C. Simonelli conclude with a study of small island states, focusing on the challenges facing the poor and marginalized in the Maldives due to both climate change and changing political agendas that prioritize mass tourism and mega-development over climate justice.

Part III of the book addresses cross-cutting issues and topics based on the case studies in Part II. It offers reflections on the case studies that tease out their practical and theoretical ramifications for strategic litigation and political mobilization. Angela P. Harris' contribution reflects on how a law and political economy approach to these environmental justice case studies reveals the common roots of these struggles in an economic order that treats nature as an infinite resource for human domination and exploitation and creates seemingly intractable human hierarchies. The final chapter by the editors considers the lessons offered by the case studies (including topics for further research) in order to overcome the fragmentation of legal frameworks and social movements and develop holistic solutions that are both just and sustainable.
